139. Rare earths. II. A mass spectrometric determination of the heats of sublimation (or vaporization) of neodymium, praseodymium, gadolinium, terbium, dysprosium, holmium, erbium and lutetium.  
*United States*. A Time of Flight mass spectrometer has been adapted for thermodynamic investigations at elevated temperatures. The apparatus is described in detail. The heats of sublimation (or vaporization) of several rare earth metals have been determined by the mass spectrometric method, from the variation with temperature of the intensity of an atomic beam effusing from a Knudsen cell, in the temperature range 125 to 2044°K.
